

Meet Nosh

Nosh is a charity that helps people on low incomes eat well without overspending. They've asked Enablis to prove out a meal-planning web site that takes the faff out of mealtimes - tasty and nutritional recipes, a weekly plan, and a shopping list that respects a tight budget.

OUR MISSION

"No one should have to choose between eating well and making ends meet."

Who they serve

Households on tight budgets — busy parents, shift workers, students. Many use older phones and shop once a week with a fixed amount to spend.

What they do

Free budget-friendly recipes, community cooking sessions and practical meal-planning support, delivered through local food hubs across the UK.

Why this app

Planning the week ahead is the biggest lever for cutting food cost and waste. Nosh wants that to feel effortless — never like homework.

enablis.

Your task

Prepare a working demo you can show to the client's Product Owner and Engineering Manager. One is focused on the product and its users, the other on how you built it, so be ready to talk about both aspects.

What we would like you to build

A working web app that lets someone:

1. Pick from a set of built-in starter recipes or add their own, each with ingredients and a method
2. Set a few basic dietary preferences, such as vegetarian or dairy-free, so the recipes on offer suit them
3. Plan recipes across the days of the week
4. Generate a combined shopping list from that plan, with the same ingredient pulled from several recipes and quantities added up sensibly

Baseline plus one.

Treat that list as the baseline. The rest of the shape is yours, and we would like you to add a feature of your own that you think makes it a stronger solution.

Ground rules

- This is an AI-assisted challenge, so use whatever AI tooling you like.
- Build it in your own time and bring it along to a session where you will demo it and talk us through how you built it.
- Manage the code as a git repo and bring the history with you.
- We may ask you to add a small feature during the session, so be ready to extend it live.
- Build it as a layered web app you can run locally, with a client UI and a separate API layer behind it. Use whatever languages you like (e.g. TypeScript, Go, Java, .NET, Node, Python).
- How you store data is your call. This is a demo, so feel free to use local storage solutions e.g. sqlite.
- We are providing a set of starter recipes as a JSON file (project-nosh-sample-recipes.json).
- Assume a single user, so there is no need for logins or authentication.
- Please do not pour days into this, around 2 to 3 hours is plenty.

There is no single right answer here.

Build it the way you would for a client, and come ready to walk us through your decisions and how you worked. We are interested in your judgement, not a checklist.

Brand essentials

Logo

- Use on Nosh Charcoal or white backgrounds.
- Keep clear space around the mark — at least the width of the “O”.
- Never recolour, stretch, rotate or add effects.

Colour

Nosh Green *primary*
#62CC9B

Deep Teal *secondary*
#3AA58F

Nosh Charcoal *backgrounds / text*
#2E373E

Flame Coral *accent*
#F3764B

Leaf *accent*
#D5C52D

Cloud Grey *muted text on dark*
#B7BFC0

Nosh Green leads. Teal and charcoal support. Flame and leaf are small accents — highlights, badges, warnings.

Typography

Aa Nosh

Nunito — rounded, friendly, free on Google Fonts

Headings: Nunito Bold (fallback Arial)

Body: Nunito Sans or system sans

Voice & accessibility

- Warm and practical — never preachy or judgemental about budgets.
- Plain language: short words, no jargon, no guilt.
- WCAG AA contrast minimum; must work well on older, smaller phones.
